WHEAT SITUATION

WS-194 OCTOBER 1965

World trade in wheat and flour during 1965-66 is likely to reach the record 2.1-billion-bushel level of 1963-64. In 1964-65, world wheat trade totaled nearly 1.8 billion bushels.

In many ways, the trade patterns of 1963-64 are being repeated in 1965-66. Large scale purchases by the USSR and Mainland China are again responsible for the expanded world trade. The USSR has purchased or contracted to purchase around 350 million bushels, with approximately 230 million of this from Canada.

SUMMARY

Total disappearance of wheat during the 1965-66 marketing year is expected to exceed production for the fifth consecutive year. As a result, carryover stocks on June 30, 1966, may decline by at least 70 million bushels from the 819-million beginning carryover.

Exports are estimated at 750 million bushels for 1965-66; although, if they were to continue at the rate of the July-September period, the total for the year would be higher than the current estimate. During the first quarter of 1965-66, exports ran at a high level, with commercial exports substantially above a year earlier. Feeding of wheat is expected to increase in 1965-66 since farm wheat prices are closer to feed grain prices than they were last year. This is especially true of soft wheat prices. During July-September 1965, feed grain prices were above a year earlier while wheat prices averaged about the same. Based on prices to date and the current disappearance estimate, the unusual pattern of last year, when the highest prices were established in the first half of the year, may be repeated in 1965-66.

The Food and Agriculture Act of 1965, recently approved by Congress, continues the voluntary certificate type program for the 1966 through 1969 crops. At the time this report was approved, October 19, this Bill had not been signed by the President. The legislation provides a program quite similar to the

present program. Price support loans, at a national average of $1.25 per bushel for the 1966 crop, are offered to producers who comply with their allotments. Marketing certificates valued at the difference between the loan level and the parity price will be issued on about 45 percent of the normal production. Parity was $2.56 per bushel in October 1965 but could change by the time the official determination must be made in June 1966. Domestic food processors will be required to purchase certificates valued at 75 cents per bushel, the same as in 1965-66, with the remainder of the certificate value met with Government funds.

The 1965 world wheat crop is slightly smaller than the record 1964 crop. The decline is mainly in the USSR and Mainland China, 2 of the 3 largest producers. Output in the "Free World", which accounts for about two-thirds of world wheat production, is slightly above last year's record harvest. As a result of this imbalance in production, world wheat trade may rise to the record level of 2.1 billion bushels set in 1963-64. The USSR has already purchased or contracted to purchase about 350 million bushels of wheat.

The rye supply in 1965-66 is considerably above a year ago. Domestic disappearance is expected to increase as a result of heavier feeding of rye but exports may not differ much from the low level of last year. The July 1, 1966, carryover is likely to rise slightly from the high level of 12.5 million bushels last July. The season average farm price for rye is likely to be somewhat below the $1.02 price-support loan rate.

NATIONAL SITUATION AND OUTLOOK

Total Supply Smaller

The supply of wheat for the 1965-66 marketing year is estimated at 2,175 million bushels, based on the October Crop report. This is slightly below a year earlier and substantially below the 5-year average (table 1). The beginning carryover of 819 million bushels was 82 million bushels below the carryover on July 1, 1964, and continues the decline in wheat stocks that started in 1962. Fiscal data on CCC holdings put Government-owned wheat at 646 million bushels on July 1, 1965. This, along with the 75 million bushels remaining under loan and reseal on that date, placed the total quantity of wheat under Government control at 721 million bushels. As a result, the July 1 carryover of "free" wheat was indicated at 98 million bushels. The October Crop report placed 1965 production at 1,354 million bushels, the largest since 1960. Imports are currently estimated at 2 million bushels for 1965-66, unchanged from a year earlier.

Domestic Disappearance to Continue High

Domestic disappearance of wheat during 1965-66 is estimated at about 675 million bushels, slightly above a year earlier and the highest since 1951-52. Last year, domestic disappearance increased due to the heavier use of wheat for feed (table 1). A further increase this year in wheat feeding is based on the expectation that wheat prices will remain close to those of feed grains.

Larger Exports Indicated

Exports of wheat and flour during 1965-66 are now placed at 750 million bushels. However, if exports were to continue at the rate of the July-September period, exports for the year would be higher than the current estimate. During the first 3 months of the current marketing year, inspections for export of wheat, as grain, have run 12 percent above the year-earlier level, totaling 183 million bushels (table 4). Most of the increase was in commercial sales. These totaled 56 million bushels and comprised 30 percent of wheat exported compared with 18 percent a year earlier. During the entire 1964-65 marketing year, exports of wheat (including flour and products) totaled 728 million bushels. Dollar sales accounted for 162 million bushels, and Government-financed shipments under the Food for Peace and similar programs accounted for the rest.

Japan remains the major cash buyer of U. S. wheat, taking nearly 20 million bushels during July-September 1965. The largest recipient of U. S. wheat countinues to be India, receiving 63 million bushels during the period; nearly all moved under Title I, P.L. 480. Pakistan, the next largest recipient of P.L. 480 wheat, received 17 million bushels; mostly under Title I (table 6).

Carryover Stocks to Continue Decline

Based on the foregoing estimates of domestic disappearance and exports, carryover stocks on June 30, 1966, may decline at least 70 million bushels from the 819-million-bushel carryover at the beginning of the year. Total disappearance in 1965-66 is placed at somewhat over 1.4 billion bushels with carryover stocks on June 30, 1966, now estimated at 750 million bushels.

Prices Remain Above Loan

Prices received by farmers for wheat during July-September 1965 averaged $1.33 per bushel, 8 cents over the national average loan rate applicable to the 1965 crop. The quarterly average price is 1 cent below that for the same months a year earlier, when the national average loan rate was $1.30. Despite the high level of wheat prices relative to the price support loan in July-September this year, they became more competitive with those of feed grains. Farm prices of wheat were lower relative to the major feed grains than during the same months in 1964 averaging only 8 cents per hundredweight over corn and 12 cents over barley. Adjusting for the greater nutritional value of wheat--5 percent over corn and 14 percent over barley--wheat was actually cheaper than these grains. See table on page 15 showing farm price relationships unadjusted.

During the 1964-65 marketing year, prices received by farmers for wheat averaged $1.37 per bushel. However, they did not follow a normal seasonal pattern. Wheat farm prices were highest during the summer and fall months. From December to June, they declined; under a normal seasonal pattern this would have been the period of highest prices. Prices this year seem to be following

last year's pattern. Farmers have again been withholding wheat from the market this season which has helped to maintain prices.

Cash for Donation Products

Future purchases by the Commodity Credit Corporation of wheat flour, rolled wheat, and bulgur for domestic and foreign donation programs will be paid for in cash only. The return to this system, after a period of time when processors were paid in Export Commodity Certificates, has been made because CCC is presently able to move sufficient quantities of their stocks into the market through the redemption of payment-in-kind certificates.

CCC Loan Activity Declines

The quantity of 1965-crop wheat put under loan through September totaled 113 million bushels, down slightly from the 122 million a year earlier (table 12). Of the wheat put under loan this year, 75 million bushels were stored in warehouses and the rest on farms. On September 30, 1965, approximately 70 million bushels of wheat remained under reseal loan from the 1964 and previous crops.

CCC sales and dispositions of wheat during the first 3 months of the current marketing year declined from the level of the same period a year earlier (table 12). About 105 million bushels of CCC wheat moved into the market; most of it represented redemption of payment-in-kind script. Sales of wheat at the statutory minimum were discontinued last spring.

THE SITUATION AND OUTLOOK BY CLASSES

Supply and disappearance estimates for the major classes of wheat have been revised in accordance with the current export estimat of 750 million bushels and the export pattern so far this marketing year. Export estimates for every class of wheat except durum have been raised (table 3).

Hard Spring and White Wheat Exports Up

During July-September 1965, exports of soft red winter wheat totaled 18 million bushels, about the same as a year earlier. Nearly one-half moved under commercial terms. Exports of hard red spring wheat made the largest increase over a year earlier (table 4). Hard red spring shipments totaled almost 14 million bushels, with nearly all of it sold under commercial terms. In the same period a year earlier, exports of this class were less than 2 million bushels. Exports of white wheat also increased substantially.

Prices Continue Above Loan

Prices of every class of wheat continue well above loan at the principal markets. The greatest strength relative to loan has been in hard wheats although soft wheats have done significantly better than a year earlier (table 7). Shortages of high-protein hard wheat in both the winter and spring crops have given additional strength to protein premiums. In the soft-wheat-producing Corn Belt and East, prices have been quite competitive with corn; the same has been true of wheat and barley in the Pacific Northwest.

THE FOOD AND AGRICULTURE ACT OF 1965

The legislation recently approved by Congress continues the voluntary wheat certificate program for the 1966 through 1969 crops. At the time this report was approved, October 19, the President had not signed this Bill into law. When this takes place, specific provisions will be announced.

The program will be quite similar to the present program. Price support loans, at a national average of $1.25 per bushel for the 1966 crop, are offered to producers who comply with their allotments. Marketing quotas are suspended while the program is in effect. Producers who are prevented from planting wheat because of natural disasters receive the same program benefits they would have received if they had planted, provided the land is not planted to any other income-producing crop.

Wheat for domestic food use will be supported at 100 percent of parity or as near as practicable. For 1966, domestic certificate wheat will be supported at parity. CCC will pay the support above $2.00, and domestic wheat processors will pay the difference between the national average price-support loan rate and the $2.00 domestic food-processor level. (In 1965-66, processors are also paying 75 cents per bushel). Domestic marketing certificates will be issued to producers to cover estimated domestic food use but the minimum number of certificates cannot be less than 500 million. They will be issued on about 45 percent of normal production. There was no minimum for certificates in 1965.

Noncertificate wheat and wheat for export will be supported through loans at a level based on the world market price and the feeding value of wheat. Export certificate costs to exporters will be on a day-to-day basis rather than on a predetermined annual value as in 1965. At the end of the marketing year, the proceeds from export certificates minus export payments will be distributed to elegible producers on a pro-rata basis. In 1965, export certificates with a pre-determined face value of 30 cents per bushel were issued to producers for 35 percent of the normal yield of their allotments.

For the 1967 through 1969 crops, the blend, or weighted average, return per bushel on the projected yield of the allotment cannot be less than the blend return per bushel in 1966--provided the required diversion is more than 10 percent.

The minimum national acreage allotment will be the number of acres needed to produce the estimated requirements on a projected national yield. No minumum acreage allotment is specified. The 1966 allotment was established at 47.8 million acres in April 1965 under the Food and Agriculture Act of 1962. Under the program applicable for the 1965 crop, the national allotment could not have been less than 49.5 million acres.

Diversion payments are authorized on additional voluntary diversion up to 50 percent of the farm allotment or 25 acres, whichever is larger. In 1965, the maximum was 20 percent or 15 acres, whichever was larger. Authority is given, under certain conditions, to allow planting on diverted acreage to a number of minor crops.

An adjustment may be made to allow for the difference in feed units of oats and/or rye when wheat is substituted for these crops. No adjustment was authorized in 1965. Producers may be authorized to plant feed grains on their wheat allotments and wheat on their feed grain permitted acres, as in 1965.

Projected yields will be established for each farm. These yields, established for each farm for computing program benefits, will be indicative of the yield per acre expected for each farm, assuming current cultural practices and normal weather conditions. Previously a 5-year average yield, subject to adjustments for abnormal weather and other factors, had been used. Generally the new method should provide a higher yield than was derived using the 5-year average.

Beginning in 1967, computation of State, county, and farm wheat allotments is simplified. Each will be computed on the basis of the preceding year's allotment instead of on the basis of 5-and 10-year history. It will nor significantly change the present acreage relationships between States, counties, and farms, but will reflect the increases made in small farm allotments under existing law. For 1966, State, county, and farm allotments are computed under the law existing before passage of the new bill.

Undesirable Varieties Designated

The USDA has designated 39 varieties of wheat as undesirable for price-support purposes under the 1966-crop price-support program. The list includes the 38 varieties designated as undesirable for 1965 as well as the variety Gaines when grown east of the Continental Divide. Gaines, a soft white wheat, remains acceptable for price support in the Pacific Northwest, an area in which it is particularly adapted. All varieties designated as undesirable have been so classified because of inferior milling or baking qualities. The new legislation provides authority to adjust or withhold certificates on farms where undesirable varieties are planted

WORLD WHEAT SITUATION

Slight Decline in World Wheat Crop

The prospective world wheat crop is 2 percent below the 1964 record harvest, but 14 percent above the 1955-59 average. The decline from last year is due mainly to reduced crops in the USSR and Mainland China, two of the three largest producers.

Wheat production in the Free World, which accounts for about two-thirds of production, is 5 percent above last year's record harvest and 11 percent above 1963. All major Free World wheat countries in North America, Asia, Europe, and Africa have record or near-record harvests.

Weather in the Northern Hemisphere was generally favorable for the production of winter wheat. Acreages were increased last fall, and winter-kill was at a minimum. However, the spring was late, with cold and rainy weather, which delayed growth in many countries. Above-normal rainfall continued through the summer delaying harvesting of both winter and spring wheat. This also cut down on expected yields in a number of countries of the Northern Hemisphere.

Despite unfavorable spring weather, latest estimates for the United States and Canada indicate exceptionally large wheat harvests. As of October 1, the U. S. crop was estimated slightly above that of 1964. Based on a recent report, Canada's crop of 704 million bushels is about 100 million more than in 1964, but slightly below the record 723 million of 1963. Acreage in Canada declined 5 percent from 1964 but high yields are in prospect. Mexico also had a record crop.

Western Europe's wheat production is forecast at 3 percent above that in 1964 with acreage at a record level. Despite late harvests, serious losses by flooding, and some lodging of grain, yields are well above average with record yields being realized in several countries.

Record wheat crops in France and the United Kingdom stemmed from acreage increases of 3 and 16 percent, respectively, and above-average yields. A near-record wheat crop is expected in Italy. Principal European countries affected by the cool, rainy season and late harvests were West Germany, Austria, and Belgium. Crops in Spain and Portugal were larger than expected and considerably above the poor harvests of 1964, but they were below average.

Production in Eastern Europe increased moderately over the high level of 1964. Very good harvests were in prospect in Bulgaria, Rumania, and Poland. In Czechoslovakia, production may be about the same as the below average 1964 crop. Partially offsetting, were declines in East Germany and Yugoslavia.

USSR production reportedly declined 15 to 20 percent from the good crop of 1964. Winter wheat output was larger than average. However, the spring crop was severely damaged by dry, hot weather later in the season.

Despite a 10-percent drop in Mainland China's wheat crop, Asia's wheat harvest showed a moderate increase. Record crops in India and Pakistan were 22 and 7 percent larger, respectively, than the good harvests of the preceding season. Production in the Middle East increased 8 percent over 1964. Large crops were harvested in Turkey, Iran, Iraq, Jordon, Syria, and Lebanon.

In Mainland China, unfavorable planting weather limited wheat acreage, possibly to 90 percent of the year before. This apparently held wheat production down by the same amount.

Countries in North Africa also had good wheat harvests, especially Morocco and Egypt. Production in Tunisia was larger than the small crop of 1964, but was less than in 1963.

Early season prospects in the Southern Hemisphere are for possibly smaller crops than the exceptionally large production of 1964. It is too early to know the extent of the area to be planted in South America. A small decline in acreage is likely in Argentina. So far, weather has been generally favorable in South America for another good season.

Wheat acreage in eastern Australia was sharply reduced by drought--especially in New South Wales, producer of 41 percent of last year's crop, and in Queensland. However, a million acres more were planted in western Australia, and conditions there are more favorable.

World Trade to Rise

World trade in wheat and flour during 1965-66 is likely to approach the record of 56.0 million metric tons (2.1 billion bushels) in 1963-64. In 1964-65, it totaled about 50.0 million tons (1.8 billion bushels).

In the Free World, trade is expected to remain near the level of 1964-65 of about 40.0 million tons (1.5 billion bushels). Increased requirements in some Western European countries and the continued growth of the Japanese wheat market are expected to balance lower requirements in some other areas where better crops have reduced the need to import.

Imports by Communist countries, as in 1963-64, will be responsible for the expected increase in world trade. In many ways the trade patterns of 1963-64 are being repeated this year. Large-scale purchases by the Soviet Union are again the major factor. Also, large purchases by China and imports by the countries of Eastern Europe are continuing.

Imports by the Communist countries reached 19.0 million tons (700 million bushels) in 1963-64. So far in the current year, these countries have purchased nearly 16.0 million tons (590 million bushels); more than 9.0 million tons (350 million bushels) of this were purchased by the Soviet Union.

In spite of this high level of trade in prospect, supplies of wheat in exporting countries appear more than ample. Exportable supplies in the major exporting countries, as the marketing year began, were well over those of a year ago. Record or near-record crops were expected, even though some countries had bad weather during harvest. Commitments to Communist countries and expected exports to traditional markets have brought a tightening of the world supply picture. However, in the absence of further substantial purchases by Communist countries, no supply shortage is expected.

The Wheat Situation is published in February, May, July and October.

The next issue will be released in late February 1966.

RYE SITUATION AND OUTLOOK

Supply Increases

The total supply of rye in 1965-66 is estimated at 46.3 million bushels, 12 percent above last year and 3 percent above the 1958-62 average (Table 2). The beginning carryover of 12.5 million bushels on July 1, 1965, was more than double that of a year earlier and the largest since 1961. CCC owned about 5.9 million bushels on July 1, 1965, compared with only 0.8 million bushels a year earlier. The 1965 crop is estimated at 32.8 million bushels, about 2 percent smaller than last year. Imports are currently estimated at 1 million bushels, down from the 2.4 million of last year but in line with the large internal supply.

The portion of the carryover in private hands--"free" stocks--totaled an estimated 6.0 million bushels, the highest level since the 8.3 million on July 1, 1961. In 1959-63, July 1 free stocks averaged 5.4 million bushels.

Yield a Record

The 1965 rye crop is estimated at 32.8 million bushels, down 2 percent from last year but about 4 percent above the 1958-62 average. Production is expected to be above last year in the major rye-producing North Central region but below 1964 in some other areas. North Dakota, which accounts for around one-third of the annual output of rye, produced 18 percent more than last year. Production in South Dakota, the second largest producer, was also up from a year earlier. Kansas and Nebraska, both major producers in the past, harvested smaller crops this year due to substantial cutbacks in acreage.

U. S. rye yields reached a record high in 1965--22.1 bushels per harvested acre. Record or near-record yields in most rye-producing States offset the 14 percent reduction in harvested acreage, thus preventing a large decline in production.

Disappearance and Carryover to Rise

Total disappearance of rye in 1965-66 is estimated at around 33 million bushels, up 14 percent from last year. Domestic disappearance will account for most of this increase since feeding of rye is expected to rise. In 1964-65, about 12 million bushels of rye were used for feed, 5 million above the previous year and 2½ million above average. During 1965-66, a large supply and lower loan rate may encourage additional use of rye for feed.

Rye used for food is estimated at 5 million bushels, the same as a year earlier. This follows the trend in recent years of increasing population offsetting decreasing per capita consumption of rye. Estimates of rye used for seed and industry are also unchanged from the 1964 levels of 6.0 and 3.8 million bushels, respectively.

Exports are estimated at 3.0 million bushels for 1965-66, up slightly from the quantity exported last year but substantially below average. In the first quarter of the marketing year, slightly less than a million bushels had been exported or inspected for export, compared with 1.3 million during the same period in 1964-65.

Europe's 1965 rye crop is down slightly from last year, with Western Europe accounting for most of the decline. This could add some stimulus to U. S. exports, although large crops in Canada, the USSR, and Poland tend to offset any advantage the United States might accrue from the smaller European crop.

With total disappearance of rye estimated at 32.8 million bushels, the carryover at the end of the marketing year, June 30, 1966, would be about 13.5 million. This would be up from the beginning carryover which was the largest since 1961.

Rye Prices Lower

The national average price support loan rate for 1965-crop rye is $1.02 per bushel, down 5 cents from the 1964 rate. The average price to farmers during 1964-65 was $1.03 per bushel, 4 cents below the support price. Prices to farmers averaged 94 cents during July-September 1965, compared with $1.01 a year earlier. The season-average price in 1965-66 may not be as well maintained relative to the price-support loan rate as in 1964-65 if the current supply-disappearance relationship prevails during the remainder of the crop year.

No. 2 rye at Minneapolis averaged $1.11 per bushel during July-September 1965 compared with $1.23 last year. The terminal loan rate at Minneapolis was reduced from $1.29 in 1964-65 to $1.24 in 1965-66.

Farmers made extensive use of the price-support program during 1964-65, placing 5.3 million bushels under loan. They delivered 5.8 million bushels, including direct purchases by CCC under the price support program. Through September 1965, about 3.1 million bushels had been placed under loan from the 1965 crop.

Canadian Rye Situation

The 1965 Canadian rye crop is estimated at 17.2 million bushels, about 30 percent above last year's crop. This resulted from a 10 percent increase in acreage and record yields. With an August 1, 1965, carryover of 8.3 million, Canada's total supply for 1965-66 is placed at 25.5 million bushels, the largest in a decade.

An allowance of 6 million bushels for domestic use would leave around 20 million available for export and carryover. Exports during the past 5 years have averaged around 5 million bushels annually.

World Production Increases

World rye production for 1965 is about 3 percent above last year's crop of 1,234 million bushels and is the largest since 1961. Total acreage was relatively unchanged from the 70 million of 1964, but there has been a small increase in per-acre yields (table 23).

The combined production of the USSR, Europe, and North America, accounted for over 90 percent of the 1965 world rye crop. The world's two largest rye-producing countries--the Soviet Union and Poland--are expecting larger crops in 1965 due to more acreage and increased yields.

Europe's crop of around 590 million bushels is down 6 percent from last year, continuing the trend of declining rye production. The West European crop was 15 percent below 1964 and nearly a fourth less than the 1955-59 average of 267 million bushels. Rye acreage in Western Europe continued to decline, dropping 3 percent from last year and 25 percent below the 1955-59 average.

The East European rye crop is estimated at 387 million bushels, little changed from that of recent years. Increased yields have offset a decrease in acreage, thus maintaining production.

1/ Cash grain prices are on-track cash prices established at the close of the market. The effective support price is the established terminal support less the storage charges to the maturity date of the price support loan. Export prices are basis prompt or 30-day shipment. Net export prices are derived by subtracting export payment rates. The export marketing certificate is included in the computation of the net export price. Wheat used for domestic food must be accompanied by a domestic marketing certificate which is not included in the domestic prices shown. 2/ Not available for high-protein wheats since quality premiums are based on a combination of sedimentation tests and protein tests. 3/ Not applicable if market is not an established price support terminal or if the price is an export price.

1/ Based on 73 percent extraction rate, cost of 2.28 bushels: At Kansas City, No. 1 Hard Winter, 13 percent protein, and at Minneapolis, No. 1 Dark Northern Spring, simple average of 13 percent and 15 percent protein. Includes domestic certificate beginning July 1964. 2/ Quoted as 95 percent patent at Kansas City and standard patent at Minneapolis, bulk basis. 3/ Assumes 50-50 millfeed distribution between bran and shorts or middlings, bulk basis. 4/ Preliminary.

Compiled from reports of Consumer and Marketing Service and Bureau of Labor Statistics, Department of Labor.

1/ Excludes the wheat equivalent of exports of flour milled in bond. Includes principal products other than flour except for bulgur and rolled wheat which were shipped for relief in 1962-64.
2/ Includes USSR. Beginning 1956, includes additional intra-Communist Bloc exports not fully accounted for in previous years.
3/ Preliminary.
4/ Includes transhipments through Canada.

Foreign Agriculture Service, Grain and Feed Division.

1/ Include full-duty wheat, wheat imported for feed, and dutiable flour and other products in terms of wheat. Exclude wheat imported for milling in bond and export as flour, also flour free for export. 2/ Excludes shipments to United States Territories, and wheat for military food use at home and abroad. 3/ This is the residual figure, after all other disappearance has been taken into account. 4/ Takings for military food use at home and abroad. 5/ Include flour wholly from U. S. wheat and other products in terms of wheat. Include exports for relief or charity by individuals and private agencies. 6/ Shipments are to United States Territories. 7/ Preliminary. 8/ Known disappearance is larger than that indicated by stocks.

Earlier data in following releases: Annual--1935-54, WS-180, August 1962, and Grain and Feed Statistics, issued June 1962. Half years--1948-62, WS-191, February 1965; 1944-54, WS-156, October 1957, and Grain and Feed Statistics, issued May 1957; 1935-48, Grain and Feed Statistics, issued March 1965.

1/ Imports of wheat of milling quality have been limited to a quota of 800,000 bushels per year since May 29, 1941, of which 795,000 may come from Canada. Imports of registered and certified wheat seed are permitted ex-quota. 2/ Imports of flour have been limited to a quota of 4,000,000 pounds per year since May 29, 1941, of which 3,815,000 pounds may come from Canada (total quota is 93,200 bushels, wheat equivalent). Flour for special experimental purposes may be imported ex-quota. Excludes flour "free for export". 3/ Consists of food products, for example--macaroni products, wheat breakfast foods, bread and biscuits, semolina and prepared mixes. 4/ Includes exports for relief or charity by individuals and private agencies. 5/ Does not include estimated bulgur relief shipments, 1962-64. 6/ Preliminary. 7/ Includes transhipments through Canada.

Bureau of the Census.

Earlier data in following Wheat Situations: 1940-56, October 1962; 1935-56, October 1961; 1910-56, April 1959.

1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1965 is combined with preliminary forecasts for the Southern Hemisphere harvests, which will begin late in 1965 and end in 1966. 2/ Harvested acreage as far as possible. 3/ Preliminary estimates for Northern Hemisphere countries, for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date. 4/ Estimated totals include allowances for producing countries not shown.
5/ Tentative unofficial estimates for production.
** September estimates.
Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.

1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1965 is combined with preliminary forecasts for the Southern Hemisphere harvests, which will begin late in 1965 and end early in 1966. 2/ Harvested acreage as far as possible. 3/ Preliminary estimates for Northern Hemisphere countries, for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date. 4/ Estimated totals include allowances for producing countries not shown. 5/ Tentative unofficial estimates for production.

** September estimate.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.
